

RED KNOT (*Calidris canutus rufa*) MONITORING AT
CAPE LOOKOUT NATIONAL SEASHORE

2012 SUMMARY REPORT

USFWS Photo

NATIONAL PARK SERVICE
CAPE LOOKOUT NATIONAL SEASHORE
131 CHARLES STREET
HARKERS ISLAND, NC 28531

Introduction

Serious declines in the population of red knots (*Calidris canutus rufa*) led to several petitions to the U.S. Fish and Wildlife Service for protection under the Endangered Species Act. In September 2006 the red knot was designated as a candidate for Endangered Species Act protection (Federal Register, 2006). Red knots use the Outer Banks of North Carolina as a stopover site in spring and fall migration. While not as important as some other coastal sites, the Outer Banks may still contribute to the survival of this species.

Previous monitoring of red knots at Cape Lookout National Seashore (CALO) was limited to surveys as part of a broader shorebird study in 1992 and 1993. North Core Banks had greater numbers of red knots than other areas in the Outer Banks (Dinsmore et al, 1998) but surveys in that study did not include any of the areas south of New Drum Inlet.

This report contains a summary of monitoring results for 2012 and comparisons to results from the earlier study and discussion of long-term monitoring of red knots at CALO.

Methods

Surveys for red knots were made of the entire ocean beach and inlet areas on North Core Banks (NCB) and South Core Banks (SCB) beginning in mid-March. The area between Old Drum Inlet and Ophelia Inlet was not monitored in 2012.

Our survey frequency and timing followed the International Shorebird Census guidelines for spring and fall. Counts were done near the 5th, 15th, and 25th of the month from March 15th to June 5th and from July 15th to October 15th.

Surveys were conducted by the park biologist or biological science technicians with experience identifying shorebirds. Surveys were at different times of day, tides and weather conditions. Monitors recorded the number of red knots observed, the mile location, the latitude and longitude, the amount of human disturbance, tide level and the accuracy of the count (See Appendix 1).

Results

Most of the red knots counted during our surveys were found on NCB with an average of 276 birds per count. SCB averaged 130 birds per count. NCB had the highest count of 1370 birds on April 25. SCB highest count of 684 birds was on May 25. The peak numbers for the core banks were during spring migration with 1611 birds counted on the April 25 census. The spring migration from 15 March to 5 June averaged 679 birds. There was also a small peak in late July and August when fall migrants moved back through (Figure 1). The fall migration from 15 July to 15 October averaged 182 birds. Additional counts outside of the methodology yielded 370 birds on February 17th and 39 birds on November 16th on NCB and 69 birds on the east Shackleford Banks on

November 14th. Red knots were distributed over the length of the seashore (Figure2). There were 52 banded birds re-sighted in the seashore, Appendix 2. The band re-sights were reported to www.report.bandedbirds.org

Discussion

Our monitoring confirmed the importance of the seashore as a stopover site for red knots, particularly during spring migration. The relative abundance of red knots on North Core Banks during peak spring migration was 46 birds/ kilometer compared to 34 birds/ kilometer in 1992-1993, Table 1 (Dinsmore et al, 1998). This comparison does take into account the changes in length of NCB due to inlet closures and inlet formation. The 1992-1993 study censused 34 km, whereas North Core Banks length was 29.8 km in the spring of 2012 after the reopening of Old Drum Inlet in 2011. The length of NCB in kilometers for years 2006, 2007, and 2008 was corrected in Table 1 for this report and differs from previous reports. NCB averaged more birds overall and had the highest peak count. Although the Outer Banks may not be as important as some other sites in the region, the area still provides habitat that may be important for the recovery and long-term survival of red knots.

Table 1. Red knot relative abundance on North Core Banks, 1992-2012.

Year	Date	Peak Count	Kilometers	Relative Abundance
1992-1993			34	34
2006	5-May	618	30.3	20
2007	15-May	718	30.6	23
2008	15-Apr	1287	30.6	42
2009	25-May	525	36	14
2010	15-May	927	36	26
2011	15-May	1012	36	28
2012	25-April	1370	29.8	46

Appendix 1

RED KNOT (*Calidris canutus*) SURVEY DATA SHEET Cape Lookout National Seashore

Name of Observer: _____

Date _____ Island _____ Start Time _____ End Time _____

# of REKN	Mile	Latitude (decimal degrees)	Longitude (decimal degrees)	Human Disturbance	Tide	Accuracy

Human disturbance: During this census, shorebirds were:
 A=undisturbed, B=disturbed 1-2 times, C=3-4 times, D=5-10 times, E=>10 times, X= unknown

TIDE (coastal sites): 1=high, 2=near high/RISING, 3=near high/ FALLING, 4=half/RISING,5=half/FALLING,
 6=near low/RISING, 7=near low/FALLING, 8=LOW, 9=unknown.

ACCURACY: Please indicate in each block whether your count is:
 * a true count, ** an extrapolated estimate, or circle a "guesstimate"
